

# All you would like to do with the SKA on neutral hydrogen

---

Martin Zwaan - ESO, Garching

# Who cares about neutral gas?

---

Cold gas takes up only 1% of baryon mass

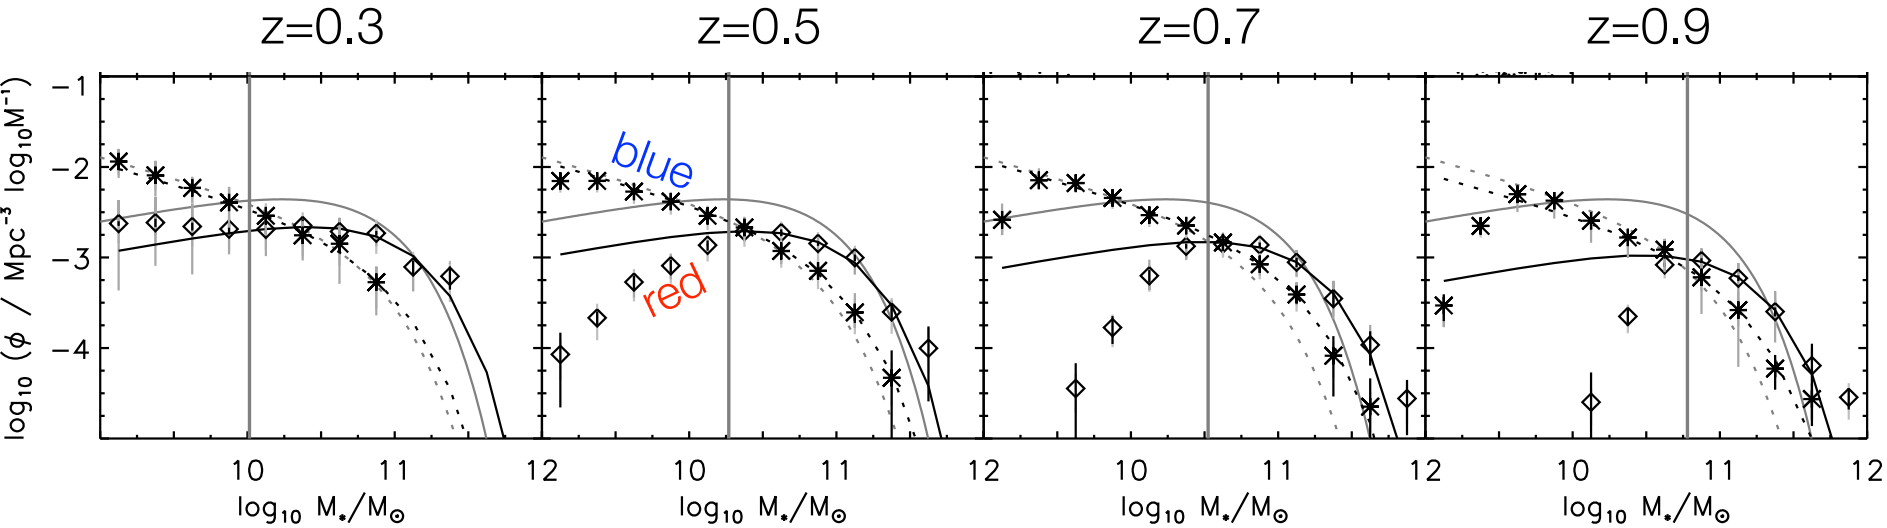

but:

- H is the most **abundant** element...
- **Fuel** for star formation (via H<sub>2</sub> ...)
- **Tracer** of galaxy dynamics
- **Search tool** for missing satellites
- **Indicator** of galaxy interactions

# Evolution of **stellar mass** and **cold gas mass**

stars

Bell et al 2007, COMBO-17

gas

Need to know the **cold gas** as function of  $z$

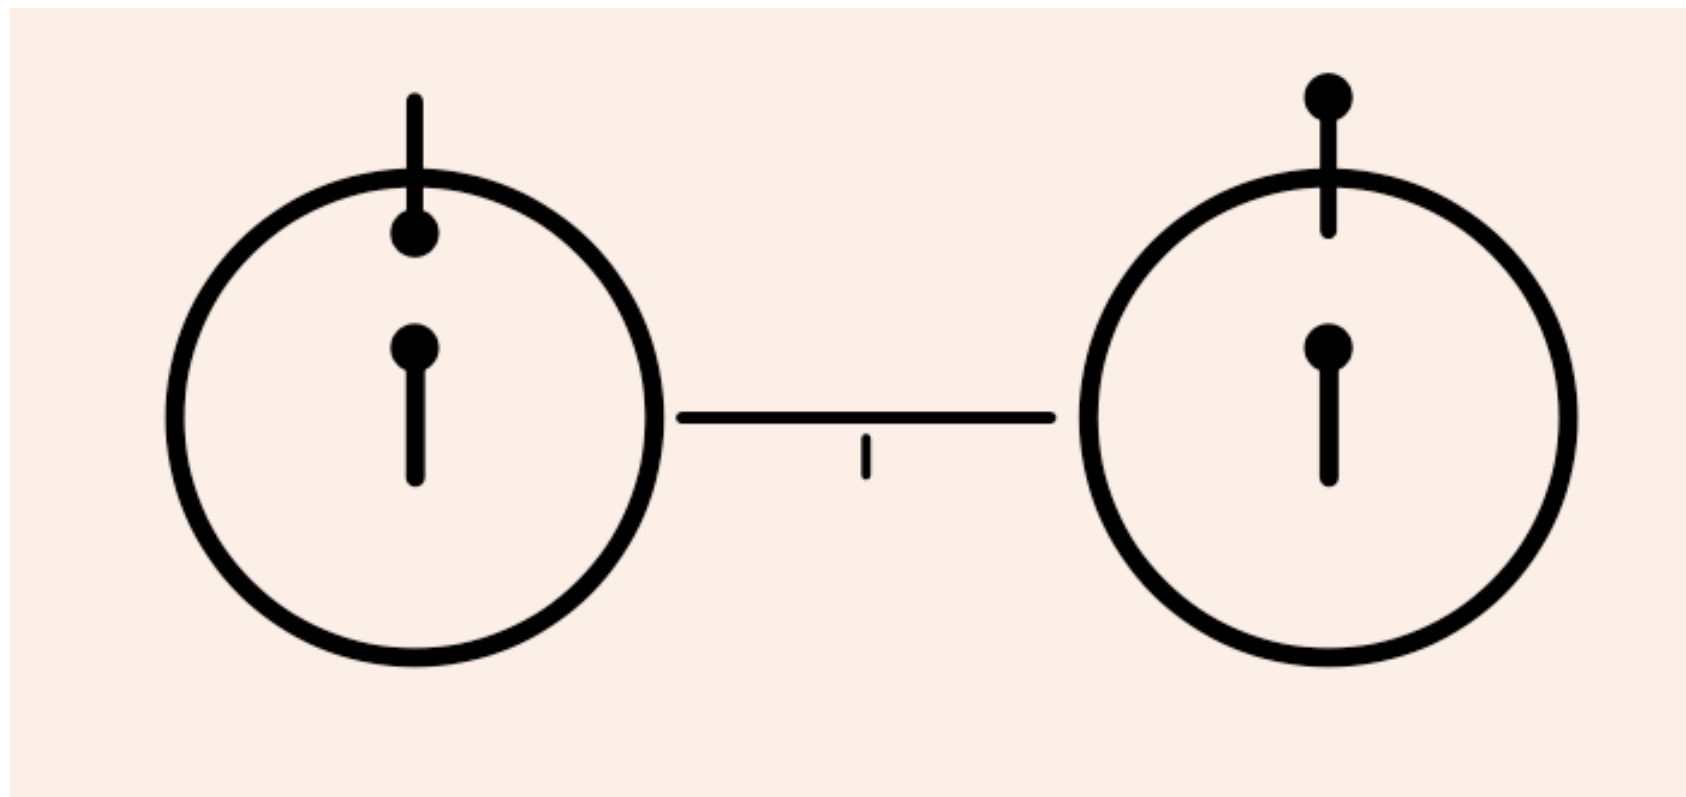

---

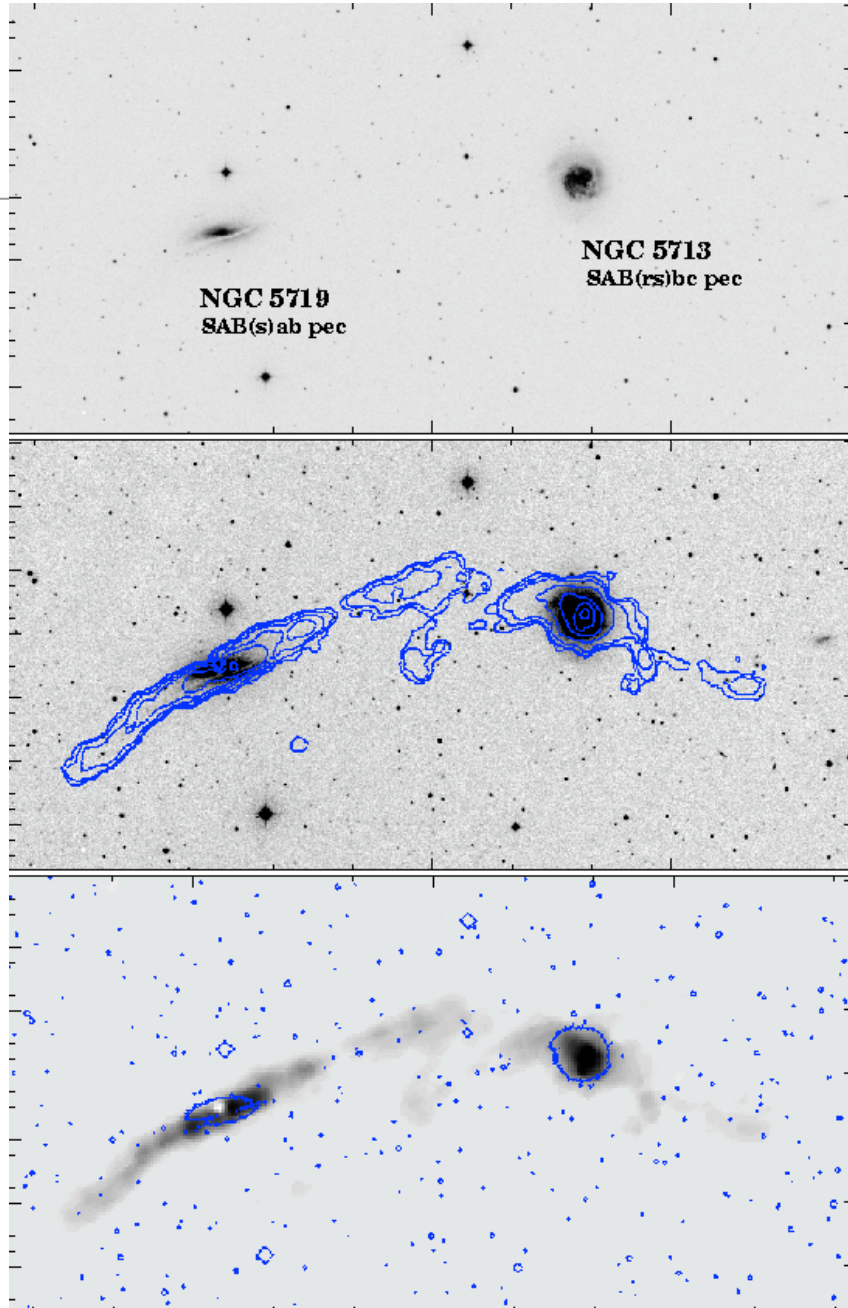

HI  $\longrightarrow$  H<sub>2</sub>  $\longrightarrow$  stars

HI is simple

---

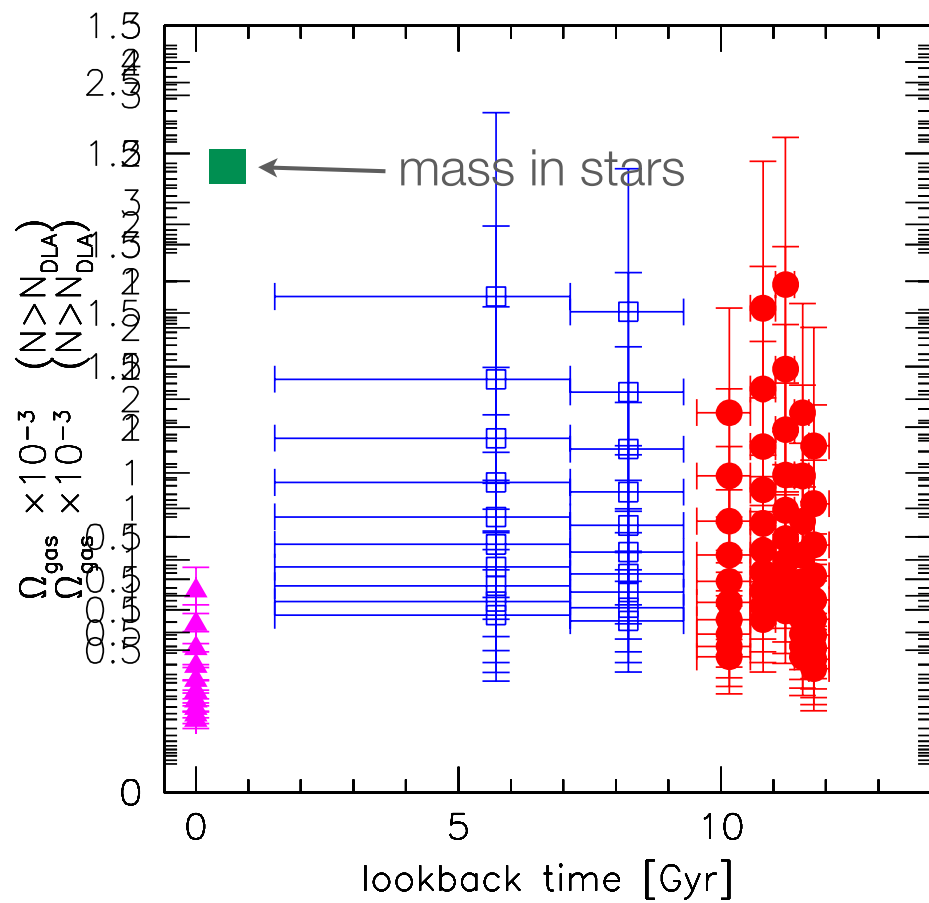

# NGC 5713/5719 System

HI rogues gallery  
(Hibbard)

# The **evolution** of the cosmic **HI** mass density

HI is a phase,  
not a reservoir

# Future challenges for HI surveys

---

Missing satellites

low mass end  
*deep & wide*

Environmental  
effects on gas  
properties

environment  
*really wide*

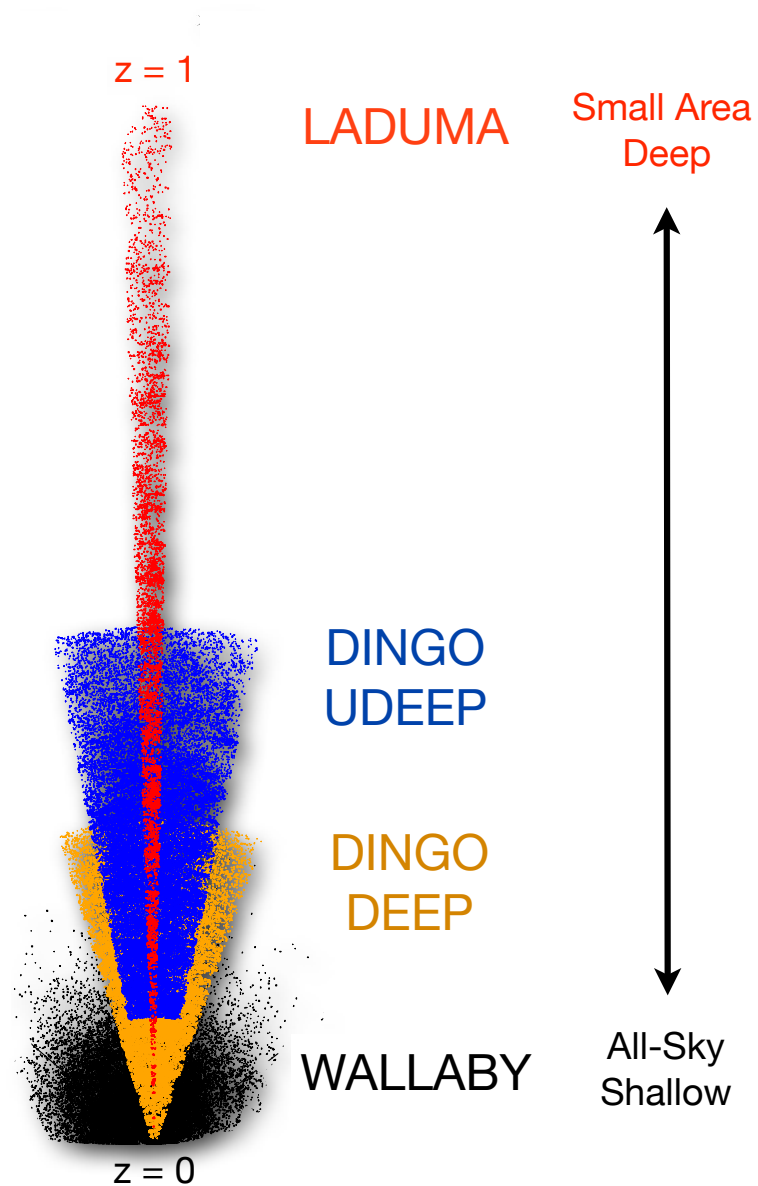

Evolution of  
cosmic gas mass

evolution  
*deep*

# Upcoming surveys with SKA Pathfinders **will cover all of this...**

---

# History of **blind HI Surveys**

**$10^4-10^6$**

**$10^6-10^9$**

*4th generation:  
SKA surveys*

*3rd generation: **SKA Pathfinders**  
WALLABY/DINGO, APERTIF, MEERKAT)*

YOU  
ARE  
HERE

**$10^3-10^4$**

*2nd generation: **HIPASS + ALFALFA** (Zwaan et al 2003,2005, Martin et al 2010)*

**$\sim 10^2$**

*1st generation: **Arecibo Surveys** (Zwaan et al 1997, Rosenberg & Schneider 2000)*

**$\sim 10^1$**

*0th generation: **Early pointed observations** (Henning et al 1987, Shostak 1977,...)*

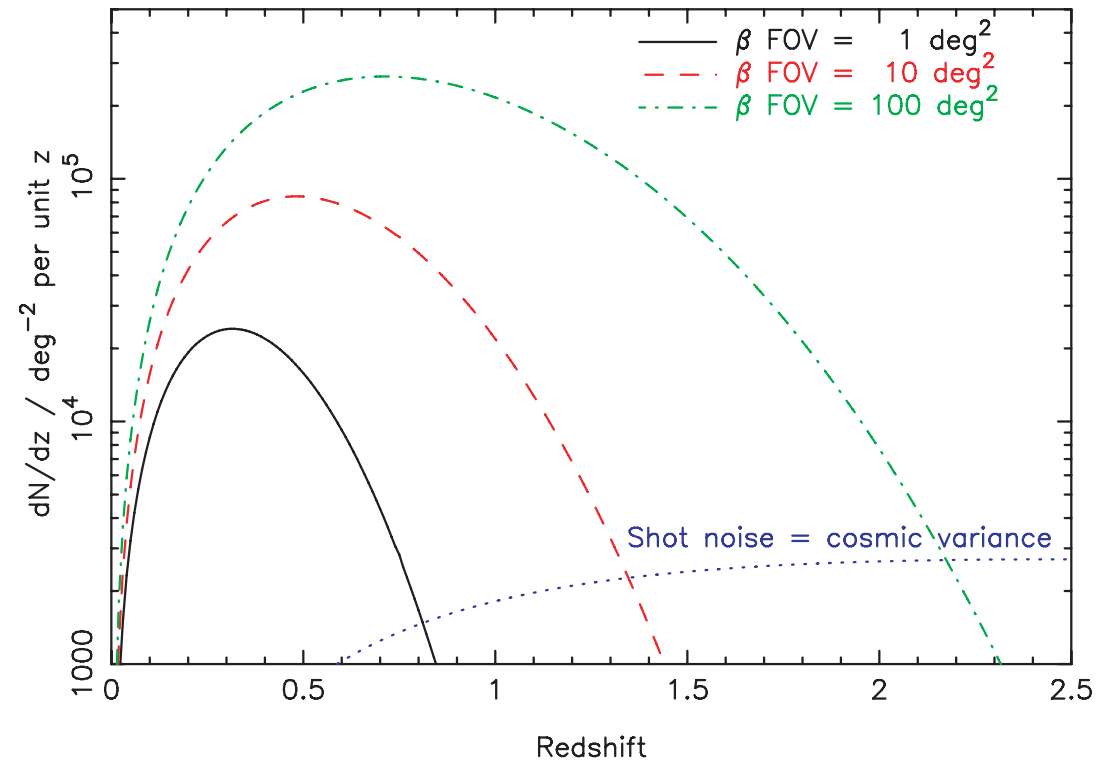

# Example: **deep field** HI survey with **SKA<sub>1</sub>**

- Single field, 1000 hours
- Frequency range 450-1430 MHz
- Angular resolution: 4", better if possible
- Spectral resolution: 18.3 kHz (4 km/s at  $z=0$ )
- Field size: 0.7 deg<sup>2</sup> at  $z=0$  increasing to 6 deg<sup>2</sup> at  $z=2$

# Example: **Wide field $z < 2$ HI survey with SKA<sub>2</sub>**

- a full SKA<sub>2</sub>, mid frequencies
- cover one hemisphere
- one year duration
- measure HI mass function and HI mass density out to  $z=1.5$
- excellent measurement of galaxy power spectrum out to  $z=1.5$

Abdalla et al 2010

# Example: **z=3 deep** HI survey with **SKA<sub>2</sub>**

- one year integration with a full SKA<sub>2</sub>, low frequencies
- Observing frequency  $\sim 350$  MHz
- Field of view  $\sim 400$  deg<sup>2</sup>
- $\sim 10^6$  galaxies at  $z=3$

Emission line (1)	Telescope and band (2)	dN/(dz dA) in 24 h		Nb. of detections in 1 yr		Nb. of stacked galaxies (26)	Signal-to-noise $n$ of a 24 h stacking (27)
		3- $\sigma$ (22)	10- $\sigma$ (23)	3- $\sigma$ (24)	10- $\sigma$ (25)

# HI Stacking

- Measure statistical properties of galaxies beyond where individual detection can be made

Measured at  $z \sim 0$

Delhaize et al in prep

Simulated at  $z=3$

Obreschkow et al 2011

# 21cm intensity mapping

---

- Measure cumulative HI 21-cm signal from galaxies
- auto-correlation: challenging measurement
- cross-correlation with optical galaxies:
  - Chang et al (2010) detected this signal with the GBT in the DEEP2 field at  $z=0.8$
- with SKA the HI power spectrum and the cosmic mass density of neutral hydrogen can be measured

Chang et al 2010

# HI with the SKA
