Correlator Capabilities

Available / Tested:

- 1-, 2-bit sampling;
- Cross-polarization
- ≤ 2048 frequency points per SB/pol
- Full-correlator integration times down to 1/4 sec
- Total observed data rates up to 1 Gbps
- Oversampling ($2,4 \times$ Nyquist \rightarrow 500 kHz SBs)
- > 16 station correlation (via multiple passes)
- Improved 2-bit van Vleck correction
- e-VLBI operation
- Phase-cal detection

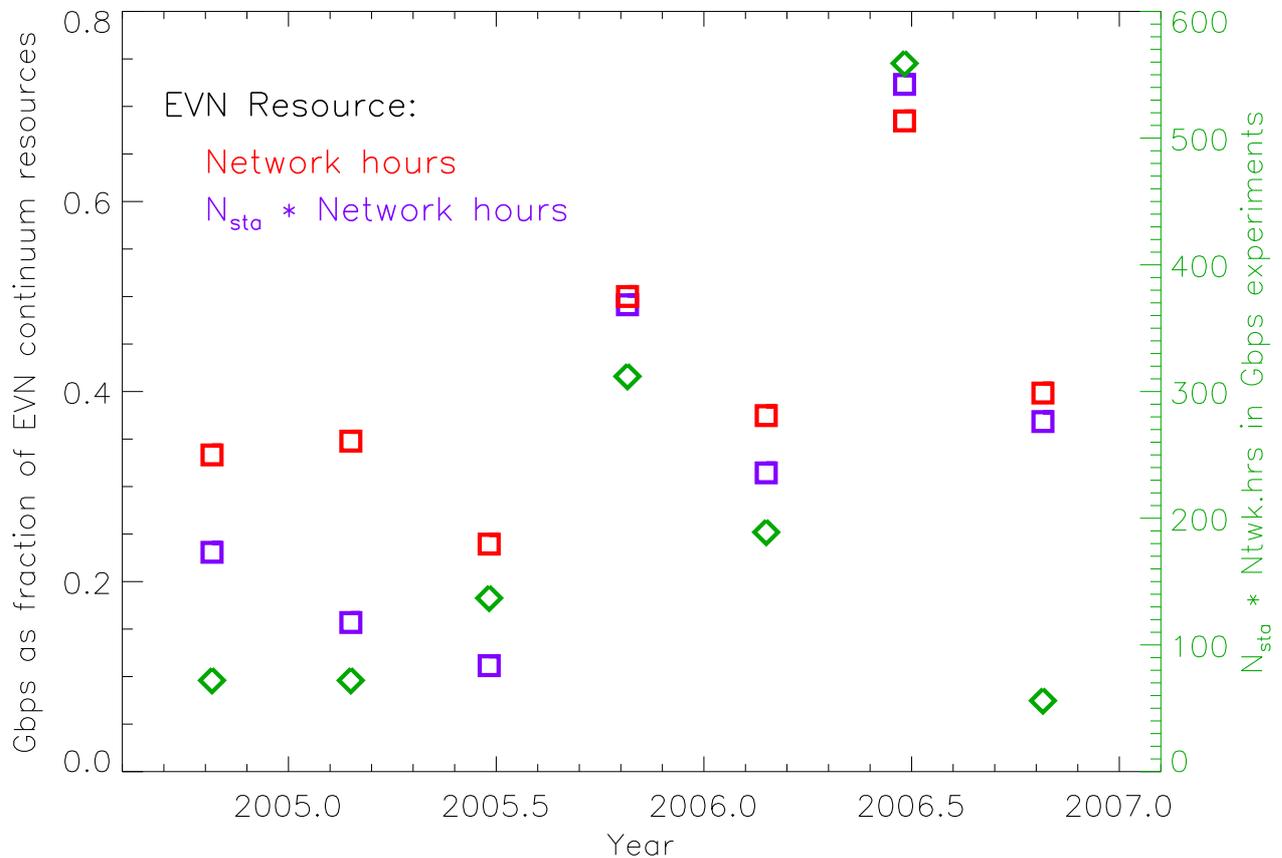

New / Tested:

- Updated *a priori* model
- Improved *UVW*s
- Correlation of 2 MERLIN out-stations

Underway / Not Fully Tested:

- Recirculation (time-sharing correlator for low-BW SBs)
- Mark 5B (double spectral resolution via global validity)

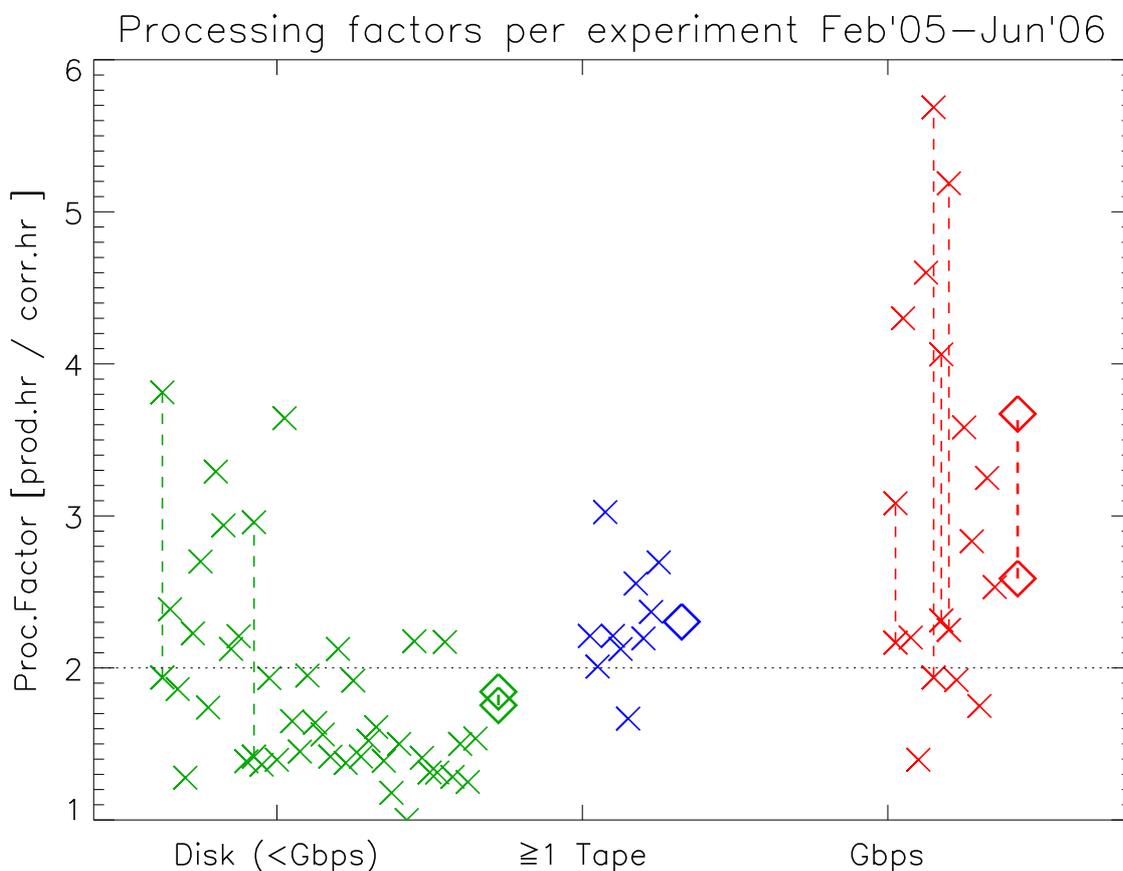

Gbps Observations in the EVN

- 1st three sessions: few Gbps stations
- Absolute load variation:
 - N_{exp} in session
 - popular line frequency-bands scheduled?

Gbps Consequences

- Processing factor increase (more re-dos)
 - Diagonal Weights (16 MHz SB BW)
 - DMM Byte Slips (64 tracks)
 - Recording Problems (video-cable interference)

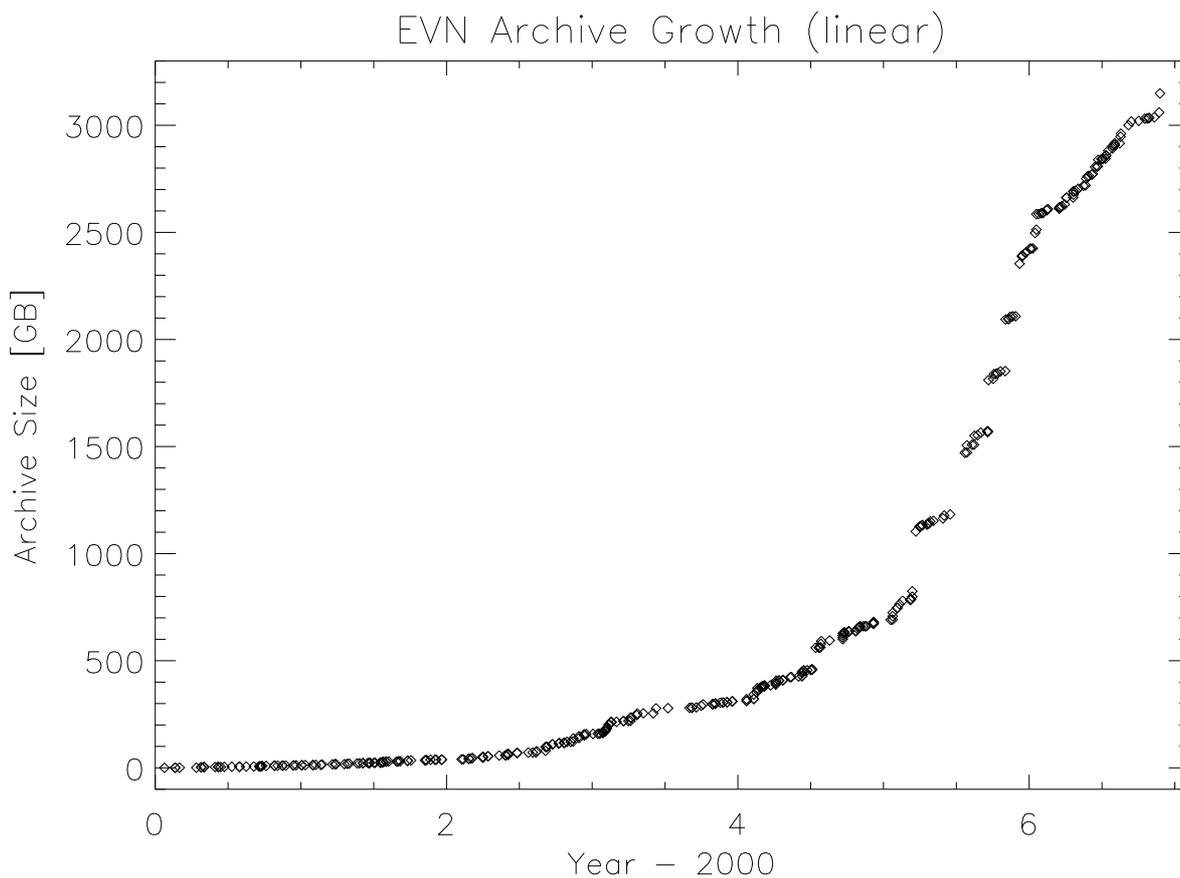

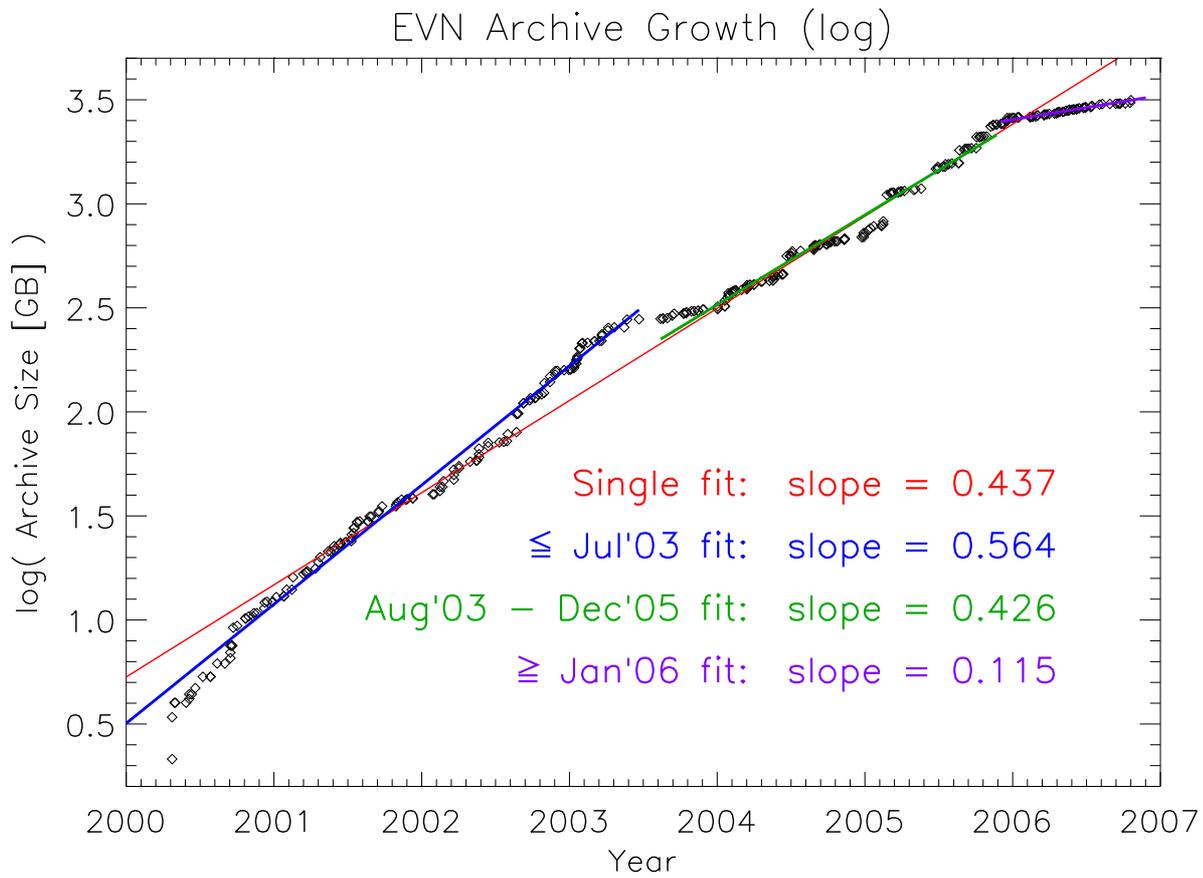

- Field of View limitations ($N_{sb} \cdot N_{pol} \geq 16$)
 - Bandwidth-smearing <10% limit ($B = 8000$ km):

$$N_{sta} \leq 8: \quad N_{\nu} \leq 128, \quad \text{FoV} \leq 49''5$$

$$N_{sta} \geq 9: \quad N_{\nu} \leq 32, \quad \text{FoV} \leq 12''3$$

EVN Archive Growth

Disk Flux

EVN (recycle within 2 sessions):

Session Pair	In [TB]	Out [TB]	Bal.	Cum.
