

# Consequences of the OPERA result

# Consequences of the OPERA result

## The Minister and the Neutrino

**Statement by the Minister Mariastella Gelmini (Rome, 23 sep 2011)**

**"The CERN and National Institute for Nuclear Physics discovery is a scientific event of fundamental importance."**

"I extend my approval and my sincerest congratulations to the authors of a historical experiment. I am deeply grateful to all the Italian researchers who contributed to this event that will change the face of modern physics.

Exceeding the speed of light is an epochal victory for scientific research around the world.

Italy has contributed to the construction of the tunnel between CERN and Gran Sasso Laboratories, through which the experiment took place, with a sum now estimated at around 45 million euros.

In addition, today Italy supports the CERN with absolute conviction, with a contribution of more than 80 million euros per year and the events we are experiencing are confirming that it is a good and far-sighted choice".

# What happens if the OPERA result is correct?

$$\frac{v - c}{c} = 2.48 \pm 0.28(\text{stat}) \pm 0.30(\text{sys}) \times 10^{-5}$$

# What happens if the OPERA result is correct?

$$\frac{v - c}{c} = 2.48 \pm 0.28(\text{stat}) \pm 0.30(\text{sys}) \times 10^{-5}$$

## Lorentz invariance

# What happens if the OPERA result is correct?

$$\frac{v - c}{c} = 2.48 \pm 0.28(\text{stat}) \pm 0.30(\text{sys}) \times 10^{-5}$$

Lorentz invariance

Causality

# What happens if the OPERA result is correct?

$$\frac{v - c}{c} = 2.48 \pm 0.28(\text{stat}) \pm 0.30(\text{sys}) \times 10^{-5}$$

~~Lorentz invariance~~

~~Causality~~

## Lorentz invariance:

Speed of light is the same in all inertial frames

Laws of physics are the same in all inertial frames

## Implication

$c$  is the maximum speed in nature!!!

Atomic clocks,  
telecommunications  
satellites, computers, GPS,  
astronomy, nuclear power....

These obviously work!!!

"Now that desk looks better. Everything's squared away, yessir, squaaaaared away."

# Causality

Causality is the relationship between an [event](#) (the cause) and a second event (the [effect](#)), where the second event is understood as a consequence of the first... (Wikipedia et al.)

# Causality

Causality is the relationship between an [event](#) (the cause) and a second event (the [effect](#)), where the second event is understood as a consequence of the first... (Wikipedia et al.)

## Not anymore?

# Causality

Causality is the relationship between an [event](#) (the cause) and a second event (the [effect](#)), where the second event is understood as a consequence of the first... (Wikipedia et al.)

Not anymore?

# The facts...

The most striking result of the OPERA experiment is the energy independence of the neutrino speed

$$13.9 \text{ GeV} : \frac{v - c}{c} = (2.16 \pm 0.76 \pm 0.30) \times 10^{-5}$$

$$42.9 \text{ GeV} : \frac{v - c}{c} = (2.74 \pm 0.74 \pm 0.30) \times 10^{-5}$$

$$3 \text{ GeV} : \frac{v - c}{c} = (5.1 \pm 2.9) \times 10^{-5} \text{ (MINOS)}$$

but...

$$10 \text{ MeV} : \frac{v - c}{c} \leq 2 \times 10^{-9} \text{ (SN1987A)}$$

In “ordinary” tachyonic theories, Lorentz invariance brakes down in Planck scales & tachyons have negative masses

$$\nu_{\geq c} \rightarrow \nu_{\leq c} + e^+ e^-$$

lower energy neutrinos should also have  $>c$  velocities!!!

high energy neutrinos should decay fast

upper limit for OPERA baseline:  $\sim 12.5$  GeV

“...Thus we refute the superluminal interpretation of the OPERA results...”

Andrew G. Cohen & Sheldon L. Glashow ([arXiv:1109.6562](https://arxiv.org/abs/1109.6562) 29-Sep)

# Speculations...

"I THINK YOU SHOULD BE MORE EXPLICIT  
HERE IN STEP TWO."

# **Can apparent superluminal neutrino speeds be explained as a quantum weak measurement?**

M V Berry<sup>1</sup>, N Brunner<sup>1</sup>, S Popescu<sup>1</sup> & P Shukla<sup>2</sup>

<sup>1</sup>H H Wills Physics Laboratory, Tyndall Avenue, Bristol BS8 1TL, UK

<sup>2</sup>Department of Physics, Indian Institute of Technology, Kharagpur, India

## **Abstract**

Probably not.

# Paper I

Giacomo Cacciapaglia, Aldo Deandrea, Luca Panizzi ([arXiv:1109.4980](https://arxiv.org/abs/1109.4980) 23-Sep)

## Abstract

Precise tests of Lorentz invariance in neutrinos can be performed using long baseline experiments such as MINOS and OPERA or neutrinos from astrophysical sources. The MINOS collaboration reported a measurement of the muonic neutrino velocities that hints to super-luminal propagation, very recently confirmed at  $6\sigma$  by OPERA. We consider a general parametrisation which goes beyond the usual linear or quadratic violation considered in quantum-gravitational models. We also propose a toy model showing why Lorentz violation can be specific to the neutrino sector and give rise to a generic energy behaviour  $E^\alpha$ , where  $\alpha$  is not necessarily an integer number. Supernova bounds and the preferred MINOS and OPERA regions show a tension, due to the absence of shape distortion in the neutrino bunch in the far detector of MINOS. The energy independence of the effect has also been pointed out by the OPERA results.

Explain the data using a step function  $\sim 1$  GeV

## Abstract

Precise tests of Lorentz invariance in neutrinos can be performed using long baseline experiments such as MINOS and OPERA or neutrinos from astrophysical sources. The MINOS collaboration reported a measurement of the muonic neutrino velocities that hints to super-luminal propagation, very recently confirmed at  $6\sigma$  by OPERA. We consider a general parametrisation which goes beyond the usual linear or quadratic violation considered in quantum-gravitational models. We also propose a toy model showing why Lorentz violation can be specific to the neutrino sector and give rise to a generic energy behaviour  $E^\alpha$ , where  $\alpha$  is not necessarily an integer number. Supernova bounds and the preferred MINOS and OPERA regions show a tension, due to the absence of shape distortion in the neutrino bunch in the far detector of MINOS. The energy independence of the effect has also been pointed out by the OPERA results.

Explain the data using a step function  $\sim 1$  GeV

# Paper II

Scalar field coupled to matter, originating from the earth

$\Phi(r)$

- Breakdown of Lorentz invariance
- $v-c/c$  depends on the baseline

but....

such a strong field would show up in satellite experiments (e.g. Cassini)

# Paper III

Jean Alexandre, John Ellis and Nick E. Mavromatos (arXiv:1109.6296 28-Sep)

- Look at how strong the  $E_\nu$  dependence should be in order to satisfy data
- New gauge-field theory with a new fermion- $U(1)$  coupling

## Implications

- Superluminal speeds arise naturally due to background  $B_\nu$  gauge field
- Light-cone seen by neutrinos is different (no causality problem)
- Particles acquire their masses dynamically... No need for a Higgs boson!
